INTRODUCTION

It is highly important to say that learning is no longer confined within the four walls of a classroom. The instructor, armed with a textbook, is no longer the sole source of educational experience. It is also known that Information resources are everywhere, often separated from the learner by time and space. Online Education defines the process of connecting learners with these remote resources. No one can deny that Learning is a lifelong pursuit where training and retraining become strategies for both individual and corporate success. It is noted that there are a variety of Online Education solutions for every educational need. It is thought that some people agree that Online Education has come a long way and opened new vistas in the field of education, some researchers are still questioning the value of learning through non traditional means. Whatever is the case, there are various opinions to consider and they are all true in their own right.

Education after COVID -19 rural areas

COVID -19 is one of the very big threat to the students’ educational life, when COVID was
at its peak point. The education imparting organizations came to halt completely.

The technological development and online apps played a very important role in the restoring of students educational life as there is diversity in our country.

In urban areas the availability of internet and media gave little life to education system but in rural areas of India, educational life totally stopped due to COVID. Teachers were not able to go to school. Therefore, the students in rural area were the main sufferers.

Post COVID 19 situation

The offline classes have resumed full time post COVID 19 with some increased attendance of students. As a teacher some common observations about students are-

- lack of attention span
- difficulty in reading from the board due to poor eye sight
- poor knowledge of basic concept
- lack of practical skills
- poor writing skills
- lack of comprehension

Students have started taking teachers for granted and have a tendency to have more fun than to study. A kind of arrogance reflects in their behavior.

One advantage of online classes was teaching aids that included videos audio and ppt could easily be used which is hard to manage in offline classes.

Teachers now really need to bridge this pandemic gap by giving their 100% dedication. Along with them it is also the huge responsibility of students as well parents so that only then the weathered education can be lifted above the mark to raise the bar higher and contribute towards our national wealth of education.
